

Ideal Customer Profile

Succinct ICP: The ideal AMOS™ customer operates complex, safety-critical maritime assets and is looking for a proven, long-term solution to control risk, compliance, and asset performance - not just another system.

Expanded ICP: AMOS™ is designed for maritime organisations that treat asset management and compliance as strategic, business-critical disciplines.

The ideal AMOS™ customer operates complex, safety-critical assets in regulated environments, where predictability, auditability, and long-term control matter more than short-term cost.

AMOS™ is not optimised for transactional buyers. It is built for operators seeking a long-term digital backbone for fleet operations.

ICP First Principle | Complexity Before Category

AMOS™ does not win on vessel count or company size alone. The defining ICP trait is **operational and regulatory complexity**, expressed through:

- Safety-critical assets
- High audit exposure
- Multi-stakeholder accountability
- Consequences of failure measured in downtime, liability, reputational risk

Vessel type, fleet size, or sector are **secondary indicators**, not primary gates.

Who We Sell To | ICP Fit Indicators

High-Fit organisations typically exhibit:

- Safety-critical, high-value assets where failure is unacceptable and demands consistent, fully controlled process management.
- Meaningful regulatory exposure (Class, Flag, ISM, PSC, ESG, regional regimes)
- Multiple vessels, sites, or asset classes requiring standardisation
- A need for traceability, auditability, and governance
- Long asset lifecycles where system longevity matters
- A preference for proven execution over untested innovation

Industry & Fleet Scope

AMOS™ is a strong fit across a wide range of maritime segments where complexity and accountability are high, including but not limited to:

- Offshore support and offshore construction
- Specialist and high-complexity vessels (subsea, cable, heavy lift, research, dredge)
- Container shipping and large cargo fleets
- Tanker and LNG operators with high compliance and uptime exposure
- RoRo, ferry, and passenger operators with safety-critical operations
- Governmental, defence, and strategic fleets with data-sovereignty requirements

The ICP is defined by **how assets are managed**.

Operational Readiness Signals *(What “Good” Looks Like)*

Ideal customers typically demonstrate:

- A strategic view of asset management and compliance
- Appetite for standardisation across fleet processes
- Dedicated technical, HSQE, or operational ownership
- Medium to high digital readiness
- Frequent audits or inspections creating reporting pressure
- Remote or low-bandwidth operational environments

Solution Mindset | A Critical ICP Filter

The ideal AMOS™ customer understands that:

- Replacing a PMS alone will not solve systemic risk
- Asset management, compliance, procurement, and data must connect
- A platform can evolve without disrupting operations

AMOS™ fits best where buyers are open to a **solution backbone** approach - even if they start with a focused use case. Buyers seeking only a cosmetic upgrade are typically poor long-term fits.

Core Problems the ICP Is Actively Trying to Solve

Asset Reliability & Maintenance • Unplanned downtime and off-hire exposure • Reactive or inconsistent maintenance execution • Limited fleet-wide visibility of asset condition	Procurement & Inventory • Emergency buying driven by poor planning • Inaccurate stock visibility • Weak spend control and supplier governance
Operational Control • Disconnected systems and inconsistent processes • No single source of truth across ship and shore	Compliance & Risk • Audit overload and manual preparation • Fragmented documentation and corrective action tracking • Increasing regulatory and ESG pressure

Buying Triggers | When AMOS™ becomes urgent

High-intent ICP moments include:

- Upcoming dry dock, refit, or life-extension programmes
- Escalating audit findings or regulatory scrutiny
- Fleet growth, acquisition, or restructuring
- Leadership changes (Technical, HSQE, Fleet, Operations)
- Legacy system fatigue or end-of-life platforms
- A strategic push toward standardisation or ESG reporting

AMOS™ is most compelling when risk and accountability are visible.

Data, Hosting & Governance Considerations

AMOS™ is particularly well suited to customers who require:

- Local, regional, or sovereign data hosting
- Hybrid or on-premise deployment models
- High security and governance standards
- Long-term control over operational data

These requirements often correlate with higher ICP fit and willingness to invest.

Red Flags - When AMOS™ Is Not the Right Fit!

AMOS™ is typically a poor fit when:

- Price is the only decision driver
- There is resistance to process standardisation
- Data quality and governance are not valued
- Buyers expect immediate value without organisational change
- The intent is to replace software, not improve control

Walking away protects time, credibility, and long-term brand value.
